

Tax Reconciliation & Lodgement Performance Dashboard

Power BI | Data Cleaning | Data Modelling | DAX

Context

This project analyses tax lodgement performance and reconciles discrepancies between internal systems and ATO records.

The goal was to identify data inconsistencies, monitor compliance, and highlight outstanding obligations. Tools used: Power BI, Power Query, and DAX.

Note: *Data has been anonymized for confidentiality. Values and client names have been modified while preserving analytical structure.*

What I did

- Cleaned and standardized multi-source data (ATO, XPM)
- Built reconciliation logic to identify unmatched clients
- Designed KPIs for lodgement performance and outstanding debt
- Developed interactive dashboards to support decision-making and performance monitoring
- Implemented interactive features including slicers and navigation buttons, allowing users to dynamically update KPIs and explore contextual insights across the dashboard.

1. Company Overview.

High-level view of client distribution, lodgements, and outstanding debt.

2. Lodgement Issues and Exceptions

Identifies discrepancies between systems and evaluates lodgement performance across time.

Key Insights:

- Individual traders represent the largest client segment
- Significant discrepancies found between ATO and internal system records
- Lodgement delays peak around mid-year reporting periods
- Outstanding debt is concentrated in a small number of clients
